

After exporting my Maya model into something Substance Painter can work with, I imported it into the program. After that, I baked the model, and added Smart Materials over to the model's layer. Black Masks were applied to all of the Smart Materials. Polygon fill was used to help apply the textures onto the model. In the layers I messed around with the material's colors and other options, along with a couple of filters. After all of that, they were exported. Not gonna lie, I felt that Substance Painter felt pretty unintuitive and very finicky. I didn't like it that much. However, this is probably because I've only touched Substance Painter for like a total of an hour before this assignment was started, and was mostly used to doing all the texturing with what was available in Maya. I think Substance Painter has a lot of potential uses, I can see why it's considered the industry standard; it just takes some getting used to. Understanding how to use masks and filters are definitely going to take some time for me. I think it's mainly due to my lack of knowledge with the program. It's a lot more technical than I'd like to be, but it's understandable why. It's just a little unclear what some tools do and how exactly to access them, or why I would need to do something in a particular way can be a little unclear. I'm already used to that kind of thing though, tbh, I don't exactly mind these things being obtuse. I assume that, as I get use to using Substance Painter, and actually acclimate to it and soak in the information I need to use it to its full potential, I'll hate it a lot less or just find it less finicky. I'd probably be able to work more faster or be able to just make something better looking in general after enough time with the program. I am curious with just how much I'm able to mess around with the program to get a desired look, and also how better I could've made it. It's possible I could've added a picture on top of the case, or add a bit of depth to some of the switches, since I didn't model that part. Overall, I hope to eventually learn more about what it's capable of, and how to achieve those capabilities in the future.
