Had to learn how to combine objects and merge meshes to make UV Mapping easier. Used camera-based projecting mapping and then used automatic mapping. Moved everything and used the cut and sew and move tool. Using only sew can mess up sizing after unfolding depending on the placement of individual shells. I may have slightly given up on the balltops, as they're usually only a singular color. Additionally, doing each individual button is very hard, and I ended up not finishing the arcade cab's buttons.
